

# Namespace WebSockets.Core

## Classes

### [ClientHandshake](#)

A sans-io implementation of the client side of the WebSocket protocol.

### [DateTimeProvider](#)

### [Handshake](#)

The base protocol class providing functionality shared by both clients and servers.

### [MessageProtocol](#)

The base protocol class providing functionality shared by both clients and servers.

### [NonceGenerator](#)

### [PublicExtensionMethods](#)

### [ServerHandshake](#)

A sans-io implementation of the server side of the WebSocket protocol.

The business layer logic is not provided. For example when a ping is received, the implementer is expected to return the pong. This is also the case for a close.

### [WebRequest](#)

### [WebResponse](#)

## Structs

### [Reserved](#)

## Interfaces

### [IDateTimeProvider](#)

### [INonceGenerator](#)

## Enums

### [HandshakeState](#)

### [ProtocolState](#)

# Class ClientHandshake

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

A sans-io implementation of the client side of the WebSocket protocol.

```
public class ClientHandshake : Handshake
```

## Inheritance

[object](#) ← [Handshake](#) ← ClientHandshake

## Inherited Members

[Handshake.State](#), [Handshake.SelectedSubProtocol](#), [Handshake.ReadData\(byte\[\], ref long, long\)](#),  
[Handshake.WriteData\(byte\[\], long, long\)](#), [object.Equals\(object\)](#), [object.Equals\(object, object\)](#),  
[object.GetHashCode\(\)](#), [object.GetType\(\)](#), [object.MemberwiseClone\(\)](#),  
[object.ReferenceEquals\(object, object\)](#), [object.ToString\(\)](#)

## Constructors

### ClientHandshake(string, string[])

Construct a client handshake.

```
public ClientHandshake(string origin, string[] subProtocols)
```

## Parameters

### origin [string](#)

The origin is the url of the initiator of the request.

### subProtocols [string](#)[]

A (possibly empty) array of requested sub-protocols.

## ClientHandshake(string, string[], IDateTimeProvider, INonceGenerator)

Construct a client handshake.

```
public ClientHandshake(string origin, string[] subProtocols, IDateTimeProvider  
dateTimeProvider, INonceGenerator nonceGenerator)
```

### Parameters

**origin** [string](#)

The origin is the url of the initiator of the request.

**subProtocols** [string](#)[]

A (possibly empty) array of requested sub-protocols.

**dateTimeProvider** [IDateTimeProvider](#)

An object which provides the current time.

**nonceGenerator** [INonceGenerator](#)

An object providing secrets.

## Methods

### ReadResponse()

Read a handshake response.

```
public WebResponse? ReadResponse()
```

### Returns

[WebResponse](#)

The response from the server, or null if a complete response has yet to be received.

## WriteRequest(string, string)

Write a handshake request.

```
public void WriteRequest(string path, string host)
```

### Parameters

**path** [string](#)

The path on the server.

**host** [string](#)

The server name.

# Class DateTimeProvider

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public class DateTimeProvider : IDateTimeProvider
```

## Inheritance

[object](#) ← DateTimeProvider

## Implements

[IDateTimeProvider](#)

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

# Properties

## Now

```
public DateTime Now { get; }
```

## Property Value

[DateTime](#)

# Class Handshake

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

The base protocol class providing functionality shared by both clients and servers.

```
public abstract class Handshake
```

## Inheritance

[object](#) ← Handshake

## Derived

[ClientHandshake](#), [ServerHandshake](#)

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

# Constructors

## Handshake(bool, string[], IDateTimeProvider)

Construct the protocol.

```
protected Handshake(bool isClient, string[] subProtocols,  
IDateTimeProvider dateServiceProvider)
```

## Parameters

**isClient** [bool](#)

If true the protocol is for a client; otherwise it is for a server.

**subProtocols** [string](#)[]

The supported sub-protocols.

## **dateTimeProvider** [IDateTimeProvider](#)

A date/time provider.

## Properties

### SelectedSubProtocol

The sub-protocol negotiated during the handshake.

```
public string? SelectedSubProtocol { get; protected set; }
```

#### Property Value

[string](#) ↗

The (possibly null) selected sub-protocol.

### State

The state of the connection.

```
public HandshakeState State { get; protected set; }
```

#### Property Value

[HandshakeState](#)

The connection state.

## Methods

### ReadData(byte[], ref long, long)

Read handshake data from the provided array into the handshake buffer.

```
public void ReadData(byte[] source, ref long offset, long length)
```

## Parameters

**source** [byte\[\]](#)

The buffer containing the data.

**offset** [long](#)

The offset into the buffer.

**length** [long](#)

The length of the data.

## WriteData(byte[], long, long)

Write data from the handshake buffer into the provided array.

```
public void WriteData(byte[] destination, long offset, long length)
```

## Parameters

**destination** [byte\[\]](#)

The array to receive the data.

**offset** [long](#)

The point in the buffer to start writing the data.

**length** [long](#)

The length of the buffer.

# Enum HandshakeState

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public enum HandshakeState
```

## Fields

Failed = 2

Pending = 0

Succeeded = 1

# Interface IDateTimeProvider

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public interface IDateTimeProvider
```

## Properties

Now

```
DateTime Now { get; }
```

Property Value

[DateTime](#)

# Interface INonceGenerator

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public interface INonceGenerator
```

## Methods

### CreateClientKey()

```
string CreateClientKey()
```

Returns

[string](#)

### CreateMask()

```
byte[] CreateMask()
```

Returns

[byte](#)[]

# Class MessageProtocol

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

The base protocol class providing functionality shared by both clients and servers.

```
public class MessageProtocol
```

## Inheritance

[object](#) ← MessageProtocol

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

## Constructors

### MessageProtocol(bool, INonceGenerator)

Construct the protocol.

```
public MessageProtocol(bool isClient, INonceGenerator nonceGenerator)
```

## Parameters

### isClient [bool](#)

If true the protocol is for a client; otherwise it is for a server.

### nonceGenerator [INonceGenerator](#)

A generator for secrets.

## Properties

## State

The state of the connection.

```
public ProtocolState State { get; protected set; }
```

## Property Value

[ProtocolState](#)

The connection state.

## Methods

### ReadData(byte[], ref long, long)

```
public bool ReadData(byte[] destination, ref long offset, long length)
```

#### Parameters

destination [byte\[\]](#)

offset [long](#)

length [long](#)

#### Returns

[bool](#)

### ReadMessage()

```
public Message? ReadMessage()
```

#### Returns

[Message](#)

## WriteData(byte[], long, long)

```
public void WriteData(byte[] source, long offset, long length)
```

### Parameters

source [byte\[\]](#)

offset [long](#)

length [long](#)

## WriteMessage(Message)

```
public void WriteMessage(Message message)
```

### Parameters

message [Message](#)

# Class NonceGenerator

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public class NonceGenerator : INonceGenerator
```

## Inheritance

[object](#) ← NonceGenerator

## Implements

[INonceGenerator](#)

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

## Fields

### \_random

```
public static readonly Random _random
```

## Field Value

[Random](#)

## Methods

### CreateClientKey()

```
public string CreateClientKey()
```

## Returns

string ↴

## CreateMask()

```
public byte[] CreateMask()
```

Returns

byte ↴ []

# Enum ProtocolState

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public enum ProtocolState
```

## Fields

Closed = 2

Closing = 1

Connected = 0

Faulted = 3

# Class PublicExtensionMethods

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public static class PublicExtensionMethods
```

## Inheritance

[object](#) ← PublicExtensionMethods

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

## Methods

### SingleCommaValues(IDictionary<string, IList<string>>, string)

```
public static string[]? SingleCommaValues(this IDictionary<string, IList<string>>  
headers, string key)
```

#### Parameters

headers [IDictionary](#)<string, [IList](#)<string>>

key [string](#)

#### Returns

[string](#)[]

### SingleValue(IDictionary<string, IList<string>>, string)

```
public static string? SingleValue(this IDictionary<string, IList<string>> headers,  
string key)
```

## Parameters

headers [IDictionary<string, IList<string>>](#)

key [string](#)

## Returns

[string](#)

# Struct Reserved

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public struct Reserved : IEquatable<Reserved>
```

Implements

[IEquatable](#)<[Reserved](#)>

Inherited Members

[ValueType.Equals\(object\)](#) , [ValueType.GetHashCode\(\)](#) , [ValueType.ToString\(\)](#) ,  
[object.Equals\(object, object\)](#) , [object.GetType\(\)](#) , [object.ReferenceEquals\(object, object\)](#)

## Constructors

Reserved(bool, bool, bool)

```
public Reserved(bool isRsv1, bool isRsv2, bool isRsv3)
```

Parameters

isRsv1 [bool](#)

isRsv2 [bool](#)

isRsv3 [bool](#)

## Properties

AllFalse

```
public static Reserved AllFalse { get; }
```

Property Value

## Reserved

### IsRsv1

```
public readonly bool IsRsv1 { get; }
```

Property Value

[bool](#) ↗

### IsRsv2

```
public readonly bool IsRsv2 { get; }
```

Property Value

[bool](#) ↗

### IsRsv3

```
public readonly bool IsRsv3 { get; }
```

Property Value

[bool](#) ↗

## Methods

### Equals(Reserved)

Indicates whether the current object is equal to another object of the same type.

```
public bool Equals(Reserved other)
```

## Parameters

### **other** Reserved

An object to compare with this object.

## Returns

### bool ↴

true ↴ if the current object is equal to the **other** parameter; otherwise, false ↴.

# Class ServerHandshake

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

A sans-io implementation of the server side of the WebSocket protocol.

The business layer logic is not provided. For example when a ping is received, the implementer is expected to return the pong. This is also the case for a close.

```
public class ServerHandshake : Handshake
```

## Inheritance

[object](#) ← [Handshake](#) ← ServerHandshake

## Inherited Members

[Handshake.State](#) , [Handshake.SelectedSubProtocol](#) , [Handshake.ReadData\(byte\[\], ref long, long\)](#) ,  
[Handshake.WriteData\(byte\[\], long, long\)](#) , [object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) ,  
[object.GetHashCode\(\)](#) , [object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) ,  
[object.ReferenceEquals\(object, object\)](#) , [object.ToString\(\)](#)

## Constructors

### ServerHandshake(string[])

```
public ServerHandshake(string[] subProtocols)
```

#### Parameters

subProtocols [string](#)[]

### ServerHandshake(string[], IDateTimeProvider)

```
public ServerHandshake(string[] subProtocols, IDateTimeProvider dateServiceProvider)
```

#### Parameters

`subProtocols` [string\[\]](#)

`dateTimeProvider` [IDateTimeProvider](#)

## Methods

### ReadRequest()

`public WebRequest? ReadRequest()`

Returns

[WebRequest](#)

### WriteRejectResponse(string)

`public void WriteRejectResponse(string reason)`

Parameters

`reason` [string\[\]](#)

### WriteResponse(WebRequest)

`public void WriteResponse(WebRequest webRequest)`

Parameters

`webRequest` [WebRequest](#)

# Class WebRequest

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public class WebRequest
```

## Inheritance

[object](#) ← WebRequest

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#)

## Constructors

WebRequest(string, string, string, IDictionary<string,  
IList<string>>)

```
public WebRequest(string verb, string path, string version, IDictionary<string,  
IList<string>> headers)
```

## Parameters

verb [string](#)

path [string](#)

version [string](#)

headers [IDictionary<string, IList<string>>](#)

## Properties

### Headers

```
public IDictionary<string, IList<string>> Headers { get; }
```

## Property Value

[IDictionary](#)<[string](#), [IList](#)<[string](#)>>

## Path

```
public string Path { get; }
```

## Property Value

[string](#)

## Verb

```
public string Verb { get; }
```

## Property Value

[string](#)

## Version

```
public string Version { get; }
```

## Property Value

[string](#)

## Methods

Parse(string)

```
public static WebRequest Parse(string data)
```

## Parameters

**data** [string](#) ↗

## Returns

[WebRequest](#)

## ToString()

Returns a string that represents the current object.

```
public override string ToString()
```

## Returns

[string](#) ↗

A string that represents the current object.

# Class WebResponse

Namespace: [WebSockets.Core](#)

Assembly: WebSockets.Core.dll

```
public class WebResponse
```

## Inheritance

[object](#) ← WebResponse

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

## Constructors

WebResponse(string, int, string, IDictionary<string, IList<string>>, byte[]?)

```
public WebResponse(string version, int code, string reason, IDictionary<string, IList<string>> headers, byte[]? body)
```

## Parameters

version [string](#)

code [int](#)

reason [string](#)

headers [IDictionary<string, IList<string>>](#)

body [byte\[\]](#)

## Properties

## Body

```
public byte[]? Body { get; }
```

## Property Value

[byte](#)[]

## Code

```
public int Code { get; }
```

## Property Value

[int](#)

## Headers

```
public IDictionary<string, IList<string>> Headers { get; }
```

## Property Value

[IDictionary](#)<[string](#), [IList](#)<[string](#)>>

## Reason

```
public string Reason { get; }
```

## Property Value

[string](#)

## Version

```
public string Version { get; }
```

Property Value

[string](#)

## Methods

Parse(byte[])

```
public static WebResponse Parse(byte[] data)
```

Parameters

[data](#) [byte](#)[]

Returns

[WebResponse](#)

ToBytes()

```
public byte[] ToBytes()
```

Returns

[byte](#)[]

# Namespace WebSockets.Core.Messages

## Classes

### [BinaryMessage](#)

### [CloseMessage](#)

A message indicating the connection should be closed.

If this is an initiating message the other side will respond with a close with the same code and reason.

### [DataMessage](#)

The base class for all messages which hold raw data.

### [Message](#)

The base class for all WebSocket messages.

### [PingMessage](#)

A ping message.

### [PongMessage](#)

The message used to respond to a ping message.

### [TextMessage](#)

A message with text data.

## Enums

### [MessageType](#)

The types of messages.

# Class BinaryMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

```
public class BinaryMessage : DataMessage, IEquatable<Message>,
IEquatable<DataMessage>
```

## Inheritance

[object](#) ← [Message](#) ← [DataMessage](#) ← [BinaryMessage](#)

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[DataMessage](#)>

## Inherited Members

[DataMessage.Data](#), [DataMessage.Equals\(DataMessage\)](#), [Message.Type](#),  
[Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#), [Message.Deserialize\(byte\[\]\)](#),  
[Message.Equals\(Message\)](#), [object.Equals\(object\)](#), [object.Equals\(object, object\)](#),  
[object.GetHashCode\(\)](#), [object.GetType\(\)](#), [object.MemberwiseClone\(\)](#),  
[object.ReferenceEquals\(object, object\)](#), [object.ToString\(\)](#)

# Constructors

## BinaryMessage(byte[])

```
public BinaryMessage(byte[] data)
```

## Parameters

data [byte](#)[]

# Class CloseMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

A message indicating the connection should be closed.

If this is an initiating message the other side will respond with a close with the same code and reason.

```
public class CloseMessage : Message, IEquatable<Message>, IEquatable<CloseMessage>
```

## Inheritance

[object](#) ← [Message](#) ← CloseMessage

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[CloseMessage](#)>

## Inherited Members

[Message.Type](#), [Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#),  
[Message.Deserialize\(byte\[\]\)](#), [Message.Equals\(Message\)](#), [object.Equals\(object\)](#),  
[object.Equals\(object, object\)](#), [object.GetHashCode\(\)](#), [object.GetType\(\)](#),  
[object.MemberwiseClone\(\)](#), [object.ReferenceEquals\(object, object\)](#), [object.ToString\(\)](#)

## Constructors

### CloseMessage(ushort?, string?)

Construct a close message.

If a reason is given a code must be specified.

```
public CloseMessage(ushort? code, string? reason)
```

## Parameters

code [ushort](#)?

An optional code.

## reason [string](#)

An optional reason.

# Properties

## Code

A code indicating the reason for the close.

```
public ushort? Code { get; }
```

## Property Value

### [ushort](#)?

The code.

## Reason

A reason for the close.

```
public string? Reason { get; }
```

## Property Value

### [string](#)

The reason.

# Methods

## Equals(CloseMessage?)

Indicates whether the current object is equal to another object of the same type.

```
public bool Equals(CloseMessage? other)
```

## Parameters

### **other** [CloseMessage](#)

An object to compare with this object.

## Returns

### [bool](#)

[true](#) if the current object is equal to the **other** parameter; otherwise, [false](#).

# Class DataMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

The base class for all messages which hold raw data.

```
public abstract class DataMessage : Message, IEquatable<Message>,  
IEquatable<DataMessage>
```

## Inheritance

[object](#) ← [Message](#) ← DataMessage

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[DataMessage](#)>

## Derived

[BinaryMessage](#), [PingMessage](#), [PongMessage](#)

## Inherited Members

[Message.Type](#) , [Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#) ,  
[Message.Deserialize\(byte\[\]\)](#) , [Message.Equals\(Message\)](#) , [object.Equals\(object\)](#) ,  
[object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) , [object.GetType\(\)](#) ,  
[object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) , [object.ToString\(\)](#)

# Constructors

## DataMessage(MessageType, byte[])

Construct a data message.

```
public DataMessage(MessageType type, byte[] data)
```

## Parameters

### type [MessageType](#)

The type of the message.

**data** [byte](#)[]

The message data.

## Properties

### Data

The data associated with the message.

```
public byte[] Data { get; }
```

### Property Value

[byte](#)[]

The message data.

## Methods

### Equals(DataMessage?)

Indicates whether the current object is equal to another object of the same type.

```
public bool Equals(DataMessage? other)
```

### Parameters

**other** [DataMessage](#)

An object to compare with this object.

### Returns

[bool](#)

[true](#) if the current object is equal to the **other** parameter; otherwise, [false](#).

# Class Message

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

The base class for all WebSocket messages.

```
public abstract class Message : IEquatable<Message>
```

## Inheritance

[object](#) ← Message

## Implements

[IEquatable](#)<[Message](#)>

## Derived

[CloseMessage](#), [DataMessage](#), [TextMessage](#)

## Inherited Members

[object.Equals\(object\)](#) , [object.Equals\(object, object\)](#) , [object.GetHashCode\(\)](#) ,  
[object.GetType\(\)](#) , [object.MemberwiseClone\(\)](#) , [object.ReferenceEquals\(object, object\)](#) ,  
[object.ToString\(\)](#)

# Constructors

## Message(MessageType)

Construct a message.

```
protected Message(MessageType type)
```

## Parameters

type [MessageType](#)

The message type.

# Properties

## Type

The message type.

```
public MessageType Type { get; }
```

## Property Value

### [MessageType](#)

The type of the message.

# Methods

## Deserialize(byte[])

Deserialize data into a message.

```
public static Message Deserialize(byte[] data)
```

## Parameters

### [data byte\[\]](#)

The data to deserialize.

## Returns

### [Message](#)

The deserialized message.

## Equals(Message?)

Indicates whether the current object is equal to another object of the same type.

```
public bool Equals(Message? other)
```

## Parameters

### other [Message](#)

An object to compare with this object.

## Returns

### [bool](#)

[true](#) if the current object is equal to the **other** parameter; otherwise, [false](#).

## Serialize(bool, Reserved?, long, INonceGenerator?)

Serialize the message to bytes.

```
public byte[] Serialize(bool isClient, Reserved? reserved = null, long maxFrameSize  
= 9223372036854775807, INonceGenerator? nonceGenerator = null)
```

## Parameters

### isClient [bool](#)

If true this is a client message, otherwise it is a server message.

### reserved [Reserved?](#)

The reserved bits.

### maxFrameSize [long](#)

The maximum size of a frame.

### nonceGenerator [INonceGenerator](#)

A generator for client masks.

## Returns

[byte](#) []

The message, serialized to bytes.

# Enum MessageType

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

The types of messages.

```
public enum MessageType
```

## Fields

Binary = 1

Close = 4

Ping = 2

Pong = 3

Text = 0

# Class PingMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

A ping message.

```
public class PingMessage : DataMessage, IEquatable<Message>, IEquatable<DataMessage>
```

## Inheritance

[object](#) ← [Message](#) ← [DataMessage](#) ← PingMessage

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[DataMessage](#)>

## Inherited Members

[DataMessage.Data](#), [DataMessage.Equals\(DataMessage\)](#), [Message.Type](#),  
[Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#), [Message.Deserialize\(byte\[\]\)](#),  
[Message.Equals\(Message\)](#), [object.Equals\(object\)](#), [object.Equals\(object, object\)](#),  
[object.GetHashCode\(\)](#), [object.GetType\(\)](#), [object.MemberwiseClone\(\)](#),  
[object.ReferenceEquals\(object, object\)](#), [object.ToString\(\)](#)

## Constructors

### PingMessage(byte[])

Construct a ping message.

```
public PingMessage(byte[] data)
```

## Parameters

**data** [byte](#)[]

The data that the pong message should return.

# Class PongMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

The message used to respond to a ping message.

```
public class PongMessage : DataMessage, IEquatable<Message>, IEquatable<DataMessage>
```

## Inheritance

[object](#) ← [Message](#) ← [DataMessage](#) ← PongMessage

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[DataMessage](#)>

## Inherited Members

[DataMessage.Data](#), [DataMessage.Equals\(DataMessage\)](#), [Message.Type](#),  
[Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#), [Message.Deserialize\(byte\[\]\)](#),  
[Message.Equals\(Message\)](#), [object.Equals\(object\)](#), [object.Equals\(object, object\)](#),  
[object.GetHashCode\(\)](#), [object.GetType\(\)](#), [object.MemberwiseClone\(\)](#),  
[object.ReferenceEquals\(object, object\)](#), [object.ToString\(\)](#)

## Constructors

### PongMessage(byte[])

Construct a pong message.

```
public PongMessage(byte[] data)
```

## Parameters

**data** [byte](#)[]

The data sent by the ping messages.

# Class TextMessage

Namespace: [WebSockets.Core.Messages](#)

Assembly: WebSockets.Core.dll

A message with text data.

```
public class TextMessage : Message, IEquatable<Message>, IEquatable<TextMessage>
```

## Inheritance

[object](#) ← [Message](#) ← TextMessage

## Implements

[IEquatable](#)<[Message](#)>, [IEquatable](#)<[TextMessage](#)>

## Inherited Members

[Message.Type](#), [Message.Serialize\(bool, Reserved?, long, INonceGenerator\)](#),  
[Message.Deserialize\(byte\[\]\)](#), [Message.Equals\(Message\)](#), [object.Equals\(object\)](#),

# Constructors

## TextMessage(string)

Construct the text message.

```
public TextMessage(string text)
```

## Parameters

**text** [string](#)

The message text.

# Properties

## Text

The message text.

```
public string Text { get; }
```

## Property Value

[string](#)

The text.

## Methods

### Equals(TextMessage?)

Indicates whether the current object is equal to another object of the same type.

```
public bool Equals(TextMessage? other)
```

#### Parameters

**other** [TextMessage](#)

An object to compare with this object.

#### Returns

[bool](#)

[true](#) if the current object is equal to the **other** parameter; otherwise, [false](#).
